

The only visible waste is at the operating face of the landfill.

Nick, Landfill Operations Manager

Landfill operations occur in a staged approach – that is we operate one active cell at a time.

This means that out of the 15 acre active cell, the only exposed area of waste at any given time is not much bigger than the size of an Olympic swimming pool – and that is covered at the end of each day with soil.

The existing quarry void which we are converting to landfill on site has strict regulations in place to ensure the final contour of the capped landfill is in line with existing local land forms.

Once an active landfill cell is filled to capacity we install additional gas extraction technology and cap the site with clay, soil and grass that is native to the local area.

We survey the landfill every month to make sure we operate according to our landfill permit.

We work with the local council and Victorian EPA to ensure that a capped landfill matches the contours of the local environment at the Melbourne Regional Landfill.
